

Sustainability Researcher/Research Analyst Job Description

£10.85/hour

We are on a mission to reduce the greenhouse gas emissions in office fitouts in the UK. To succeed we must create a well-researched database of embodied emissions of materials so that designers can choose lower emission options.

We are looking to employ someone in the UK for four to six weeks to find and analyse materials data to create the database.

No previous experience in sustainability or materials is needed (although they would be helpful) – just a good head for numbers, good skills with Excel spreadsheets and a computer to search the internet for data. This project can be done working from home.

This will be an excellent stepping-stone into a sustainability-related career and will introduce the person to a dozen or so major property, building and design companies who are leading their sectors in emissions reduction.
